Following are NPCC’s comments on CAN-0018:

- A CAN is for guidance, and should not be prescriptive as this is.
- The Draft CAN-0018 states that terminal equipment is “Any piece of equipment that is in series with the circuit and that could become a limiting element.” Equipment such as potential devices, shunt capacitors, shunt reactors, for example, do not meet this criteria as they are not connected in series with a facility, and cannot become a thermally limiting element.
